Cells are the basic unit of all forms of life. In this section we explore how structural differences between types of cells enables them to perform specific functions within the organism. These differences in cells are controlled by genes in the nucleus. For an organism to grow, cells must divide by mitosis producing two new identical cells.

The rough ER is sheets of cell membrane folded into a channels, that is attached to the membrane of the nucleus. Its function is to transport the proteins made by ribosomes, and hormones. The rough ER is covered in ribosomes, allowing for the ribosomes to directly deposit the proteins into the channels of the rough ER.

The nucleus is one of the most important organelles in a cell. It is often the largest organelle in animal cells, but this is not always the case. Nuclei contain the genetic material called DNA that is responsible for controlling and directing all cell activities. This is a very important organelle given its vital function.

The Cell Cycle The cell cycle is the series of events in the growth and division of a cell. In the prokaryotic cell cycle, the cell grows, duplicates its DNA, and divides by pinching in the cell membrane. The eukaryotic cell cycle has four stages (the first three of which are referred to as interphase): • In the G₁ phase, the cell grows.

Genetic Reflections - A Coloring Book aims to inspire young students and the public to explore the beauty of science and genetics. The organisms in this book are considered 'model' organisms, as they are widely studied in laboratories with hopes to understand human biology, disease pathologies, and ways to improve agricultural crops. Despite the great differences in shape and size, on the genetic level there are lots of similarities. In every species, DNA sequences consist of the same four building blocks (G, C, A, and T). However, slight changes in their use, even in the same gene, can occur in each species. The way our bodies and cells work are well conserved throughout evolution, even in species that may look very different from us. The beauty of our world, even on the cellular level, is apparent. Genetic Reflections - A Coloring Book is a collaboration between Ahna Skop, Elif Kurt and Caitlin Marks; two UW-Madison undergraduate Skop Lab members. This coloring book is the outcome of a year-long independent study in Life Sciences Communication with goals to broadly disseminate the Genetic Reflections scientific glass art installation created by Angela Johnson and Ahna Skop. Part of the proceeds of this book will be donated to charities and programs that support STEAM (Science, Technology, Engineering, Arts, and Mathematics) educational innovations or public outreach events.

From New York Times bestselling author Sam Kean comes incredible stories of science, history, finance, mythology, the arts, medicine, and more, as told by the Periodic Table. Why did Gandhi hate iodine (I, 53)? How did radium (Ra, 88) nearly ruin Marie Curie's reputation? And why is gallium (Ga, 31) the go-to element for laboratory pranksters?* The Periodic Table is a crowning scientific achievement, but it's also a treasure trove of adventure, betrayal, and obsession. These fascinating tales follow every element on the table as they play out their parts in human history, and in the lives of the (frequently) mad scientists who discovered them. THE DISAPPEARING SPOON masterfully fuses science with the classic lore of invention, investigation, and discovery--from the Big Bang through the end of time. *Though solid at room temperature, gallium is a moldable metal that melts at 84 degrees Fahrenheit. A classic science prank is to mold gallium spoons, serve them with tea, and watch guests recoil as their utensils disappear.

Three boys, who made a pact to stick together through the rough times in their impoverished Newark neighborhood, found the strength to work through their difficulties and complete high school, college, and medical school together.
