Cell Growth And
Division Section
Key Notes

Interphase. A cell grows and carries out all normal metabolic functions and processes in a period called G₁ (Figure [1](#)). G₁ phase (gap 1 phase) is the first gap, or growth phase in the cell cycle. For cells

Access Free Cell Growth

that will divide again, G₁ is followed by replication of the DNA, during the S phase. The S phase (synthesis phase) is period during which a cell replicates its DNA.

Cell division and

Access Free Cell Growth

growth. In unicellular organisms, cell division is the means of reproduction; in multicellular organisms, it is the means of tissue growth and maintenance. Survival of the eukaryotes depends upon interactions between many cell types, and it is essential that a

Access Free Cell Growth

balanced distribution of types be maintained. This is achieved by the highly regulated process of cell proliferation.

Section 11.1 Cell
Growth, Division, and
Reproduction

Cell Division • In eukaryotes, cell division occurs in two major stages. –The first stage, division of the cell nucleus, is called mitosis. –The second stage, division of the cell cytoplasm, is called cytokinesis.

Access Free Cell Growth

- Most eukaryotic cells go through a regular cycle of interphase, mitosis and cytokinesis.

Mitosis

Chapter 10 Cell
Growth and Division -
UrbanDine

The cell cycle is the regular pattern of growth, DNA duplication, and cell

Access Free Cell Growth

division that occurs in eukaryotic cells.

Figure 1.1 shows its four main stages: gap 1, synthesis, gap 2, and mitosis. Gap 1, synthesis, and gap 2 together make up what is called interphase. The stages of the cell cycle get their names from early studies of cell division.
