Two-phase thermosyphons are passive refrigeration devices that transfer heat against gravity. Construction is typically a closed-ended tubular vessel charged with a two-phase working fluid. The vapor phase of the working fluid fills the majority of the interior of the vessel, with the liquid phase filling the minority of the volume.

In the present paper, we investigate the overall thermal resistance of a closed two-phase thermosyphon using pure water and various water based nanofluids (of Al<sub>2</sub>O<sub>3</sub>, CuO and Laponite clay) as working fluids. We observed that all these nanofluids show inferior thermal performance than pure water.

### PERFORMANCE ANALYSIS OF CLOSED LOOP TWO PHASE THERMOSYPHON ...

Loop thermosyphons (LTS) are gravity-driven, two-phase devices that operate in a similar manner to a heat pipe in so far as a working fluid is evaporated and condensed in a closed loop to transfer heat over a given distance. Some readers may be more familiar with a traditional thermosyphon, shown in Figure 1a, where the liquid and vapor occupy a single tube.
