Endoscopic Anatomy of the Pediatric Middle Ear - PubMed. Traditionally, otologists have aimed to produce a clean, dry, safe ear with the best possible hearing result. More recently, "less invasively" has been added to this list of goals. The development of small-diameter, high-quality rigid endoscopes and high-definition video systems has made totally end ...

This is the first study assessing the anatomical features of the middle ethmoidal arteries from an endonasal endoscopic perspective. The findings of this research have clinical significance in guiding surgeries that involve the medial orbital wall, intractable epistaxis, and anterior skull base pathologies, as well as endoscopic endonasal surgeries.

The round window region is of critical importance in the anatomy of the middle ear. The aim of this paper is to describe its anatomy from an endoscopic point of view, emphasizing structures that have important surgical implications, in particular the fustis and the subcochlear canaliculus. The fustis, a smooth bony structure that forms the floor of the round window region, is a constant and important structure.

It was shown that endomeato-transtympanic endoscopy provides a panoramic view of almost all structures of the middle ear. After the resection of the posterior bone edge of 'annulus tympanicus', the use of the 45o endoscope ensured the panoramic view not only of certain structures of the middle ear (e.g. the tympanic chord, the stapedius muscle tendon, the entire pyramidal process) but also of the structures of the retrotympanic and anterior epitympanic spaces.

The development of endoscopic techniques in recent times has given rise to a new application of this tool: endoscopic surgery of the middle ear. During the 1990s endoscopy was used in otology only as a diagnostic tool and never over the eardrum. Recent developments of endoscopy in middle ear surgery have permitted an unprecedented extremely detailed view of the "in vivo" anatomy of the middle ear.

RESULTS: A total of 14 middle ethmoidal arteries were identified (10 right and 4 left), among 44 sides (22 specimens), accounting for an incidence of 31.8%. Bilateral middle ethmoidal arteries were found in 3 of 22 specimens (14%). Endonasal endoscopy features of the middle ethmoidal artery were noted. CONCLUSION: This is the first study assessing the anatomical features of the middle ethmoidal arteries from an endonasal endoscopic perspective.

Several features of the middle ethmoidal artery were observed via endonasal endoscopy: The middle ethmoidal artery crosses the fovea ethmoidalis within a bony canal, which usually form a bony ridge on the anterior skull base; The bony canal of the middle ethmoidal artery seems thicker than that of the anterior ethmoidal artery; therefore, it is difficult to identify the artery through the bone; The middle ethmoidal artery roughly runs horizontally from the orbit to the skull base; The middle ...

Because transtubar middle ear endoscopy is atraumatic, it is a valuable tool for postoperative follow-up studies. But prior 2-port endoscopy of the middle ear can be used to assess the ease of passage of the transtubar scope through anatomical structures (tubar isthmus), as well as to evaluate the diagnostic information that can be expected postoperatively.

CONCLUSION: Middle ear endoscopy through the different approaches provides the otosurgeons a clear view field of the middle ear structures, can therefore decrease the incidence of cholesteatoma recurrence and evaluate the state of the postoperative middle ear cavity.
