This new anthology offers a wide selection of readings addressing the contemporary moral issues that arise from the division between the Global North and South—"the problem of the color-line" that W.E.B. Du Bois identified at the beginning of the twentieth century and which, on a scale that Du Bois could not have foreseen, is the problem of the twenty-first. The book is interdisciplinary in scope. In addition to standard topical essays in ethical theory by philosophers such as Anthony Appiah, Martha Nussbaum, and Peter Singer, it contains essays from economists such as Amartya Sen, Joseph Stiglitz, and Thomas DeGregori, as well as current empirical data from the World Bank, IMF, United Nations, and other sources.

"This book introduces the reader to the key concepts and issues that comprise the emerging field of Technoethics, the interdisciplinary field concerned with all ethical aspects of technology within a society shaped by technology"--Provided by publisher.

This book explores the role of HRD professionals in ethical and legal decision making in the workplace. While previous books have described the need for ethics in HRD, this book presents ways that HRD scholars and professionals can influence, through collaborative relationships, effective implementation of ethical policies and legal standards in the workplace. The ethical policies of an organization provide a key insight into its values, and this book shows the relationship between those values and HRD practices, such as training and development, career development, and organization development. Exploring such topics as protected classes, diversity intelligence, employee rights, and employee privacy, this book will inform HRD scholars and professionals on researching and enhancing ethical and legal decision making in the workplace.

Climate change is a major framing condition for sustainable development of agriculture and food. Global food production is a major contributor to global greenhouse gas emissions and at the same time it is among the sectors worst affected by climate change. This book brings together a multidisciplinary group of authors exploring the ethical dimensions of climate change and food. Conceptual clarifications provide a necessary basis for putting sustainable development into practice. Adaptation and mitigation demand altering both agricultural and consumption practices. Intensive vs. extensive production is reassessed with regard to animal welfare, efficiency and environmental implications. Property rights pay an ever-increasing role, as do shifting land-use practices, agro-energy, biotechnology, food policy to green consumerism. And, last but not least, tools are suggested for teaching agricultural and food ethics. Notwithstanding the plurality of ethical analyses and their outcome, it becomes apparent that governance of agri-food is faced by new needs and new approaches of bringing in the value dimension much more explicitly. This book is intended to serve as a stimulating collection that will contribute to debate and reflection on the sustainable future of agriculture and food production in the face of global change.
