This multimedia handbook and video atlas provides an interactive learning experience for practitioners who perform interventional procedures with radiographic guidance for acute or chronic pain. The print text is a formatted portable reference for reviewing anatomy, indications, physical examination findings, set-up, technique, and risks and complications for a wide range of head, neck, spine, and pelvic interventions. Buyers also have access to the ebook for use on any mobile device or computer, and twenty-four high quality procedural videos with voice-over narration that walk you through the interventions. Covering in-demand procedures such as epidural blocks, medial branch blocks, sympathetic blocks, spinal cord stimulation, and more, these dynamic videos put you in the operating suite as each procedure unfolds. Shot from the perspective of the interventionalist with a split screen view, the videos correlate positioning of the needle on the fluoroscopic image to the movement of the practitioner's hands to help you put it all together. These videos offer the opportunity to "stand in" on actual procedures with an expert, and demonstrate proper injection technique, effective targeting, and live contrast review to build skills in interventional pain management. All of the essential high yield text, video, and image content are here in an accessible interface for residents, fellows, and seasoned practitioners looking to master interventional techniques or brush-up on current pain management procedures. Key Features: An integrated handbook, ebook, and video package—accessible anytime, anywhere Fosters dynamic teaching of interventional pain procedures A consistent approach to non-surgical pain relief, covering interventions for spine, head, neck, and pelvis Demonstrates proper technique, needle placement, and precision targeting for positive outcomes Highly illustrated quick-reference print and digital handbook link seamlessly to 24 step-by-step videos with audio

Edited by Sudhir Diwan, a former Director of Pain Medicine fellowship program at Ivy League Weill Cornell Medical College, and Timothy R. Deer, an internationally renowned expert in neuromodulation and minimally invasive spinal procedures, this atlas covers advanced procedures that normal residency and fellowship programs may not cover. It consolidates information pain fellows usually amass by traveling throughout the country to various specialized weekend courses. Advanced Procedures for Interventional Pain Management: A Step-by-Step Atlas is for physicians that know the fundamentals of pain medicine and want to push their knowledge further. Through easy-to-digest bullet points, extensive diagrams, hundreds of figures, and expanded legends beneath each illustration, this compendium covers techniques such as fluoroscopic guidance and radiation safety, endoscopic transforaminal discectomy, endoscopic direct-percutaneous discectomy, transforaminal myelogram, percutaneous facet fusion, percutaneous sacroplasty, vertebral augmentations,

percutaneous tumor ablation, percutaneous spinal fusion, minimally invasive spinal decompression (MILD), Interspinous Spacer Placement and advanced neuroaugmentation techniques like high frequency stimulation and DRG stimulation. This book also has a dedicated section on Regenerative Medicine with chapters on platelet rich plasma, stem cell therapy, and intradiscal regenerative therapy. Each chapter has a strict chapter format that includes the indications and contraindications for each procedure, a list of equipment and drugs, a step-by-step illustration-focused how-to, a list of possible post-procedural complications, and bullet-pointed clinical pearls and pitfalls. Within each chapter the authors will also cover the variations of each procedure due to different equipment. This book is ideal for pain medicine fellows, spine surgeons, and interventional pain physicians who want access to the best minds and specialized procedures in a single package.

Unrelieved chronic pain is a worldwide epidemic Chronic pain has been subject to multiple international initiatives through the World Health Organization. Interventional Pain Medicine, use of minimally invasive techniques to relieve pain, is the best approach when simpler measures such as physical therapy or medications fail. However, these procedures can be associated with significant risk and expense. Establishing uniformity in diagnostic criteria and procedural performance can reduce both morbidity and unnecessary procedures, and hence healthcare expenditures. While other texts explain how to perform these procedures, little focus has been given to diagnostic considerations: if and when these procedures should be performed. Evidence-based Interventional Pain Practice uniquely focuses on how the establishment of an accurate and specific diagnosis relates to the effectiveness of the interventions. It provides the evidence for the use of interventional pain techniques across all areas of chronic pain including: □ Head, neck and shoulder pain □ Spinal pain □ Pain in the joints and extremities □ Complex Regional Pain Syndrome □ Phantom pain Evidence-based Interventional Pain Practice provides essential knowledge for anyone who uses, or intends to use, interventional pain techniques.

Interventional Pain Management: A Practical Approach is the second edition of this comprehensive guide, which includes the latest advances in anaesthesia and brand new content, edited by international experts in anaesthesiology from the US, UK and India. Enhanced by nearly 400 images and illustrations and an accompanying DVD, this is an essential resource for anaesthesiologists.

The care of pain patients often requires a specialized knowledge base and skill set that goes beyond that of the general management of patients. Interventional Pain Medicine provides comprehensive, point-of-care information for providers of pain therapies in a portable, easy-to-navigate format. With continued advances made on interventions available to treat pain, this book offers up-to-date details and instructions on procedural techniques as well as concise yet informative discussions on anatomy, indications, preparation, and complications. Chapters are clustered into six different sections for easy review: Introduction, Cervical Spinal Injections, Lumbar Spinal Injections, Pelvic and Sacral Injections, Sympathetic Blocks, and Advanced Neuromodulation Interventions. A perfect resource for residents and fellows as well as a ready reference for practitioners, this book thoroughly covers the field of interventional management of pain patients.

Multimodality Imaging Guidance for Interventional Pain Management is a comprehensive resource that covers fluoroscopy-guided procedures, ultrasound interventions, and computed tomography (CT)-guided procedures used in interventional pain management. Fluoroscopy-guided procedures have been the standard of care for many years and are widely available and affordable. Due to the lack of radiation exposure and the ability to see various soft tissue structures, ultrasound-guided interventions are more precise and safer. Primarily performed by radiologists, the benefits, disadvantages, and basic techniques of CT-guided procedures are also included in the volume. By covering all imaging modalities, Multimodality Imaging Guidance for Interventional Pain Management allows for an efficient comparison of the capabilities of each modality.

Edited by internationally recognized pain experts, this book offers 73 clinically relevant cases, accompanied by discussion in a question-and-answer format.

Diagnosis, Management, and Treatment of Discogenic Pain - a volume in the new Interventional and Neuromodulatory Techniques for Pain Management series - presents state-of-the-art guidance on the full range of discogenic pain relief techniques performed today. Leonardo Kapural, MD and Philip Kim, MD offer expert advice on a variety of procedures to manage and treat discogenic pain. Comprehensive, evidence-based coverage on selecting and performing these techniques - as well as weighing relative risks and complications - helps you ensure optimum outcomes.
