Figures 1 and 2 are simplified block diagrams of the Passive Infrared Motion Sensor (PIMS). Figure 3 shows the location of the 17 beams of coverage within the 20 ft. x 30 ft. specified area when the optics are mounted at 7 ft. 4 inches. The system is a motion detector using transient changes in the infrared background, within specified velocities, to generate alarms. A long term infrared source would eventually blend into the overall noise background and not be detected indefinitely. A filter is used to prevent visible light from generating alarms. Since infrared detection is passive any number of units can be placed in a particular location without interference. Infrared detection becomes less sensitive

when the background temperature approaches that of the target (human intruder). Some care must be taken upon installation that clutter such as rapidly heating pipes, windows or air ducts are not located within one or more beams. Due to the long time constants involved in processing frequencies around .1 Hz, it is necessary to allow a 5 minute warmup before alarms can be considered genuine. (Author).

More fun to do is to use LEDs flashing all sensors to detect what is happening "out there" and react accordingly.

Unfortunately, each sensor has its own methods of connection: some need resistance "pull-up" and some not, some need their own sources of power and some not, some work to much stress and not others, etc. In this chapter the most common sensors are presented with examples of circuits that are used and Arduino code that make them work. He also indicated for each specific type of sensor which specific products can be found in different distributors. However, if desired, can be purchased easily once a set of different sensors thanks to "sensor pack 900" of Adafruit (code Product No. 176)
