Malnutrition and obesity are both common among Americans over age 65. There are also a host of other medical conditions from which older people and other Medicare beneficiaries suffer that could be improved with appropriate nutritional intervention. Despite that, access to a nutrition professional is very limited. Do nutrition services benefit older people in terms of morbidity, mortality, or quality of life? Which health professionals are best qualified to provide such services? What would be the cost to Medicare of such services? Would the cost be offset by reduced illness in this population? This book addresses these questions, provides recommendations for nutrition services for the elderly, and considers how the coverage policy should be approached and practiced. The book discusses the role of nutrition therapy in the management of a number of diseases. It also examines what the elderly receive in the way of nutrition services along the continuum of care settings and addresses the areas of expertise needed by health professionals to provide appropriate nutrition services and therapy.

Written and organized to be accessible to a wide range of readers, Improving America's Diet and Health explores how Americans can be persuaded to adopt healthier eating habits. Moving well beyond the "pamphlet and public service announcement" approach to dietary change, this volume investigates current eating patterns in this country, consumers' beliefs and attitudes about food and nutrition, the theory and practice of promoting healthy behaviors, and needs for further research. The core of the volume consists of strategies and actions targeted to sectors of society--government, the private sector, the health professions, the education community--that have special responsibilities for encouraging and enabling consumers to eat better. These recommendations form the basis for three principal strategies necessary to further the implementation of dietary recommendations in the United States.
