invasive video-assisted breast surgery: nipple-sparing mastectomy with a hand-held external retractor, with a single-port device, and with robotic assistance. All three techniques can be employed for radical treatment of breast cancer or for risk reduction surgery, and the last two are brand new. The techniques are clearly explained with the aid of numerous high-quality illustrations. All surgical stages are covered in detail, and helpful information is provided on key aspects of surgical anatomy, diagnostic workup, instrumentation, and postoperative management. Nipple Sparing Mastectomy is the first manual to cover these techniques, which are likely to become standard in the field of oncological breast surgery. It will be invaluable for breast surgeons who are skilled in nipple-sparing mastectomy and oncoplastic techniques or are working in breast units that offer

morbidity. Oncoplasty has become the standard of care for breast conservation surgery and can lead to improving aesthetic outcomes of breast cancer surgery, without compromising oncological outcomes. The goal of the text is to increase the competencies and performance of healthcare professionals involved in treating this patient population, which will ultimately improve the aesthetic outcomes, quality of life and overall survival of patients with breast disease and breast cancer. Written by experts in the field, chapters address a wide range of breast surgery techniques that help the general surgeon provide improved oncologic and aesthetic results for patients. The authors have detailed not only best practice for conventional procedures but also new and evolving techniques. *Oncoplastic Breast Surgery Techniques for the General Surgeon* serves

Problem: Nipple areolar complex (NAC) necrosis is a common and devastating complication following nipple sparing mastectomy (NSM) completed for both breast cancer and prophylaxis. It has been anecdotally noted that surgical technique such as incision site, reconstruction type and nipple coring technique impact survival of the NAC post NSM. However, no studies to date have looked specifically at surgical technique and the impact it plays on NAC necrosis post NSM.

Methods: Thirteen peer-reviewed clinical trials were found that commented on NAC necrosis rates post NSM completed for breast cancer and prophylaxis online via

Weill Cornell Online Library. Results: Results of this literature search showed that multiple incision sites are used for NSM, surgeons are using electrocautery and sharp dissection to core nipples in NSM, and both synthetic and autologous reconstruction is being completed post NSM. Nipple necrosis rates varied between studies. Conclusions: There are few studies that focus on how surgical technique during NSM relates to NAC necrosis. Nonetheless, a large prospective study that carefully records incision sited, nipple coring technique, and reconstruction type, and NAC necrosis rates needs to be completed to further examine how surgical technique affects NAC necrosis post NSM.

"This publication is dedicated to a comprehensive overview of breast cancer in young women for all members of the

healthcare team who treat women with breast cancer. Breast cancer requires multidisciplinary management, and as such this book provides input from epidemiology, basic science, surgical oncology, radiation oncology, medical oncology, plastic and reconstructive surgery, genetics, reproductive endocrinology, psychology and nursing. Because breast cancer in young women occurs during the reproductive years, additional emphasis is placed on managing breast cancer in pregnant patients, as well as reproductive options for breast cancer survivors. The contributors to this volume comprise 30 experts from 6 academic institutions across 10 disciplines. By presenting a clear and comprehensive review of all aspects of breast cancer treatment in young women, the contributors hope to have provided a valuable resource to assist with patient

In breast reconstruction, flap based procedures and implant based procedures are the two major modalities that have emerged as surgical options for patients. These are both continuing to evolve as new, innovative techniques help to improve outcomes and patient satisfaction. This book is divided into four sections. The first section includes overviews of mastectomy options and considerations in breast reconstruction procedure selection. The next section comprises non microsurgical reconstruction options which include implant based reconstruction refinements, the emerging role of fat grafting, and a novel technique of robotic latissimus flap harvesting. The third section is devoted to microsurgical reconstruction including flap refinements,
