Part of the classic Fudge series from Judy Blume, bestselling author of Tales of a Fourth Grade Nothing! Fudge is obsessed with money. He’s making his own “Fudge Bucks” and has plans to buy the entire world. But life gets really crazy when Fudge and his older brother, Peter, run into their long-lost relatives, the Howie Hatchers. Now they have to deal with annoying twin cousins and a weird younger cousin, coincidentally named Farley Drexel Hatcher—just like Fudge! Their names aren’t the only similarity, and before long, mini-Fudge is causing just as much trouble as Fudge always has! “As a kid, Judy Blume was my favorite author, and Tales of a Fourth Grade Nothing was my favorite book.”—Jeff Kinney, author of the bestselling Wimpy Kid series Love Fudge, Peter, and Sheila? Read all the books featuring your favorite characters: Tales of a Fourth Grade Nothing Otherwise Known as Sheila the Great Superfudge Fudge-a-Mania

This book is about the Zynq-7000 All Programmable System on Chip, the family of devices from Xilinx that combines an application-grade ARM Cortex-A9 processor with traditional FPGA logic fabric. Catering for both new and experienced readers, it covers fundamental issues in an accessible way, starting with a clear overview of the device architecture, and an introduction to the design tools and processes for developing a Zynq SoC. Later chapters progress to more advanced topics such as embedded systems development, IP block design and operating systems. Maintaining a 'real-world' perspective, the book also compares Zynq with other device alternatives, and considers end-user applications. The Zynq Book is accompanied by a set of practical tutorials hosted on a companion website. These tutorials will guide the reader through first steps with Zynq, following on to a complete, audio-based embedded systems design.

Linux® is being adopted by an increasing number of embedded systems developers, who have been won over by its sophisticated scheduling and networking, its cost-free license, its open development model, and the support offered by rich and powerful programming tools. While there is a great deal of hype surrounding the use of Linux in embedded systems, there is not a lot of practical information. Building Embedded Linux Systems is the first in-depth, hard-core guide to putting together an embedded system based on the Linux kernel. This indispensable book features arcane and previously undocumented procedures for: Building your own GNU development toolchain Using an efficient embedded development framework Selecting, configuring, building, and installing a target-specific kernel Creating a complete target root filesystem Setting up, manipulating, and using solid-state storage devices Installing and configuring a bootloader for the target Cross-compiling a slew of utilities and packages Debugging your embedded system using a plethora of tools and techniques Details are provided for various target architectures and hardware configurations, including a thorough review of Linux’s support for embedded hardware. All explanations rely on the use of open source and free software packages. By presenting how to build the operating system components from pristine sources and how to find more documentation or help, this book greatly simplifies the task of keeping complete control over one’s embedded operating system, whether it be for technical or sound financial reasons.Author Karim Yaghmour, a well-known designer and speaker who is responsible for the Linux Trace Toolkit, starts by discussing the strengths and weaknesses of Linux as an embedded operating system. Licensing issues are included, followed by a discussion of the basics of building embedded Linux systems. The configuration, setup, and use of over forty different open source and free software packages commonly used in embedded Linux systems are also covered. uClibc, BusyBox, U-Boot, OpenSSH, httdp, tftp, strace, and gdb are among the packages discussed.
