Cardiovascular System Physiology Functions of the Cardiovascular System. The cardiovascular system has three major functions: transportation of materials, protection from pathogens, and regulation of the body ' s homeostasis. Transportation: The cardiovascular system transports blood to almost all of the body ' s tissues. The blood delivers essential nutrients and oxygen and removes wastes and carbon dioxide to be processed or removed from the body.

The first “wearable” in cardiovascular medicine dates back to the 1800s when a watch with a second hand was used to measure heart rate. Today, however, wearables are more likely to be patient initiated, measuring everything from heart rate and rhythm to blood pressure, sleep quality and duration, and physical activity.
