This new encyclopedia discusses the extraordinary importance of internet technologies, with a particular focus on the Web.

The primary objective of this project was to learn what effect a computer program would have on academic achievement and attitude toward science of college students enrolled in a biology class for non-science majors. It became apparent that the instructor also had an effect on attitudes toward science. The researcher designed a computer program, the CELE program, for use in instruction on photosynthesis and cellular respiration. The researcher modified existing instruments to assess academic achievement in understanding photosynthesis and cellular respiration and to assess student attitudes toward these topics. The researcher also used concept maps to assess student understanding of the material. The CELE program had no significant effect on academic achievement or student attitudes, which was possibly due to students' not engaging with the program as anticipated. The instructor had a significant effect on student attitudes toward photosynthesis and cellular respiration as well as on misconceptions that were not detected on the pretest but were detected on the posttest.

Drawing from the author's own work as a lab developer, coordinator, and instructor, this one-of-a-kind text for college biology teachers uses the inquiry method in presenting 40 different lab exercises that make complicated biology subjects accessible to major and nonmajors alike. The volume offers a review of various aspects of inquiry, including teaching techniques, and covers 16 biology topics, including DNA isolation and analysis, properties of enzymes, and metabolism and oxygen consumption. Student and teacher pages are provided for each of the 16 topics.

Achievement assessment has undergone a major shift, from what some call a 'culture of testing' to a 'culture of assessment'. Nowadays, a strong emphasis is placed on the integration of assessment and instruction, on assessing processes rather than just products, and on evaluating individual progress relative to each student's starting point. This book addresses assessment issues in light of the present state of affairs. The first part discusses new alternatives in the assessment of achievement in various subject areas, focusing on agenda, practice, impact and evaluation of the assessment. The second part deals with issues related to assessment of the learning process, specifically: questions concerning the assessment of individual differences in prior knowledge, learning skills and strategies.
